### Common Wrist Injury Treatment Options:

**Immobilization** is the most common way to treat strains, sprains, breaks, fractures, and carpal tunnel. A wrist brace is used to keep the wrist in place. This allows time for the wrist to heal properly and helps you feel better in the long run.

**Medications** – while medications won't heal the injury or problem, they may reduce or temporarily alleviate pain.

**Physical Therapy** can promote proper healing and help to relieve pain in the wrist area.

OUR DURABLE AND EASY TO ADJUST PERFORMANCE WRIST BRACE WILL HELP YOU TO BE ACTIVE AGAIN
